

Company:
Tesco Inc.

Software Used:
Keychain Synch

Wireless Equipment Supplier Increase Consumable Sales.

Summary:

In order to increase the ease with which their customers were able to replace their consumable products this wireless equipment supplier commissioned a customized and rebranded version of Proxis Software's Keychain Synch data collection software for use with their consumable sales initiative.

With the Keychain Synch application their customers are able to scan item barcodes and scan quantity barcodes to quickly and efficiently create re-stocking orders for small consumable items. After download the scans to the desktop ordering application their customers can review the scanned data, make changes, and upload the generated text file to an ordering server with instant order confirmation and minimal mistakes.

The Keychain Synch software downloads barcode scans from a keychain barcode scanner like the Opticon OPN2001 or Symbol CS1504, stores them in a text file and Access database, and can even upload these text files automatically to an FTP server for processing or import into an ordering system.

Keychain Synch is digitally signed and tested rigorously to ensure its safety and security when deployed in various customer facing environments.
